

# Rapidity Gaps in Photoproduction

**ZEUS Collaboration Meeting**

**Warsaw**

Patrick Ryan

University of Wisconsin

Analysis: C. Gwenlan, M. Sutton, P. Ryan

Oct. 15, 2003

# Outline

- **Introduction**
- **Comparisons to MC and between analyses**
- **Cross Sections and Gap Fractions**
- **HERWIG Study**
- **Summary**

# Motivation

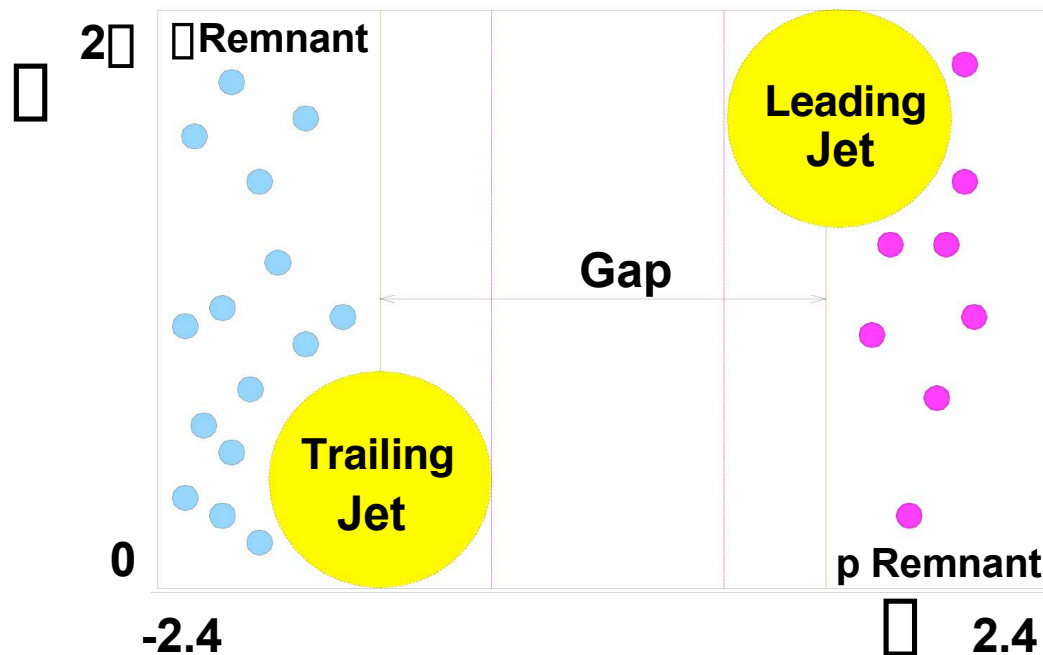

- Use pQCD to study a diffractive (soft) process
- Hard Diffractive Photoproduction
  - Hard: High  $E_T$  Jets
  - Diffractive: Gap Between jets
  - Photoproduction:  $Q^2 \sim 0$

# Topology of Rapidity Gaps

- Jets found using  $k_T$  inclusive algorithm
- Distance between jet centers:  $\Delta\eta$
- $E_T^{\text{Gap}} = \text{Sum of } E_T \text{ of jets between leading and trailing jets}$
- Gap Event:  $E_T^{\text{Gap}} < E_T^{\text{Cut}}$
- Gap may indicate color singlet exchange

# The Gap Fraction

**Dijet Events with Rapidity**  
**Gap ( $E_T^{\text{Gap}} < E_T^{\text{Cut}}$ )**

**All Dijet Events**

$$f(\Delta\eta) = \frac{d\sigma_{\text{Gap}} / d\Delta\eta}{d\sigma / d\Delta\eta}$$

**Expectation for Behavior of Gap Fraction**  
 (J.D. Bjorken, V. Del Duca, W.-K. Tung)

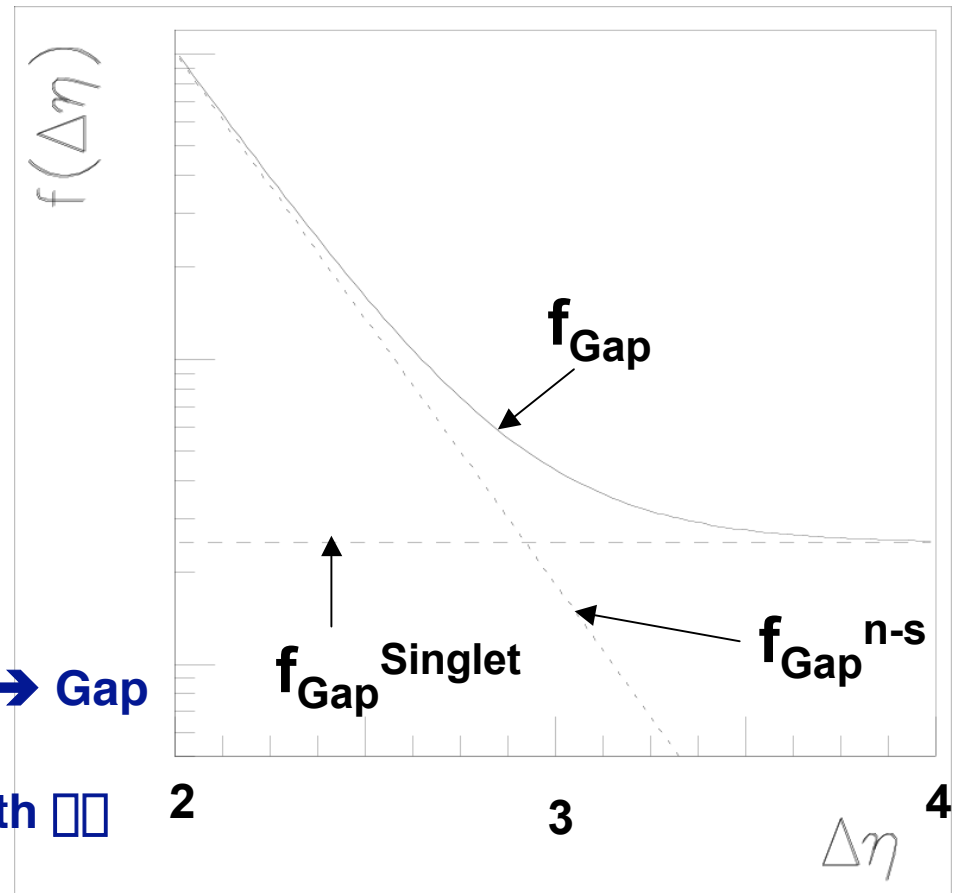

$$\sigma_{\text{Gap}} = \sigma_{\text{gap}}^{\text{Singlet}} + \sigma_{\text{gap}}^{\text{Non-Singlet}}$$

**• Singlet**

- $f(\Delta\eta)$  constant in  $\Delta\eta$

**• Non-Singlet**

- Particle production fluctuations  $\rightarrow$  Gap
- Non diffractive exchange
- $f(\Delta\eta)$  decreases exponentially with  $\Delta\eta$

# Event Selection

## •96-97 Reprocessed Data

### •HPP Trigger

- FLT Slot 42
- SLT HiEt I/II/III
- TLT HPP14 (DST bit 77)

### •Offline Cleaning Cuts

- $|z_{\text{vtx}}| < 40$  cm
- No Sinistra95  $e^+$  with
  - $P_e > 0.9$ ,  $E_e > 5$  GeV,  $y_e < 0.85$
- $0.2 < y_{jb} < 0.85$

## •Jet Selection

- $|\ln|^{1,2}| < 2.4$
- $(1/2) * (|\ln|^{1,2}| + |\ln|^{2,1}|) < 0.75$
- $2.5 < |\ln|^{1,2}| < 4.0$
- $E_T^{1,2} > 4.8, 4.0$  GeV (Cells)
- $E_T^{1,2} > 5.1, 4.25$  GeV (Zufos)
- $E_T^{1,2} > 6.0, 5.0$  GeV (Had)

## •Gap Sample

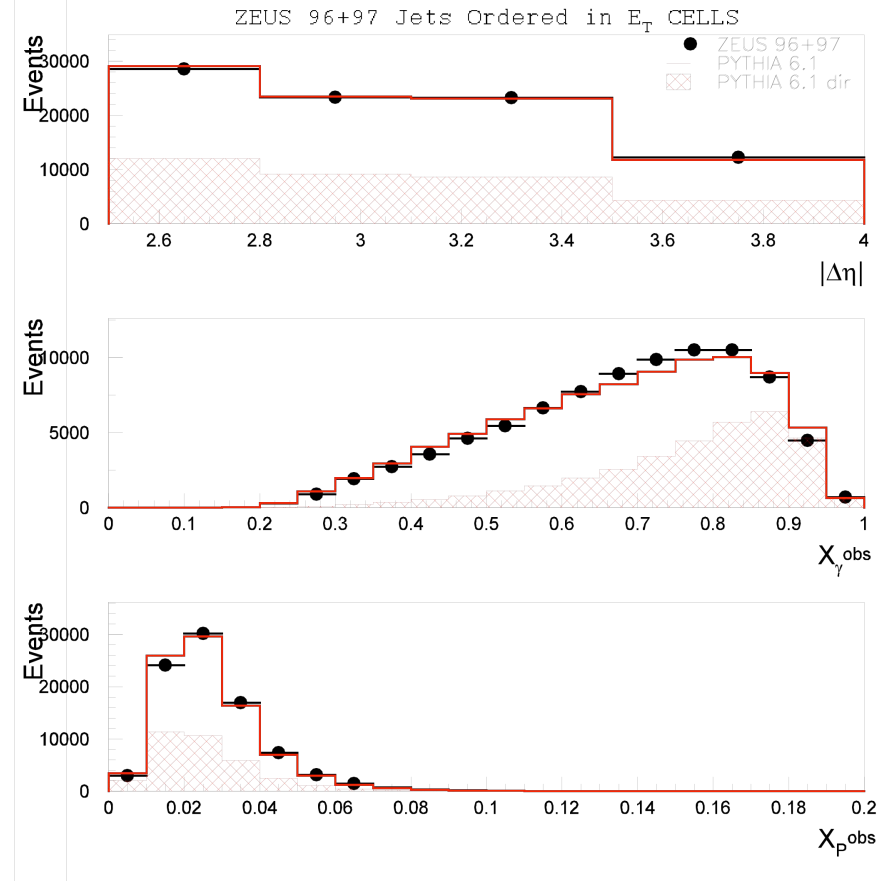

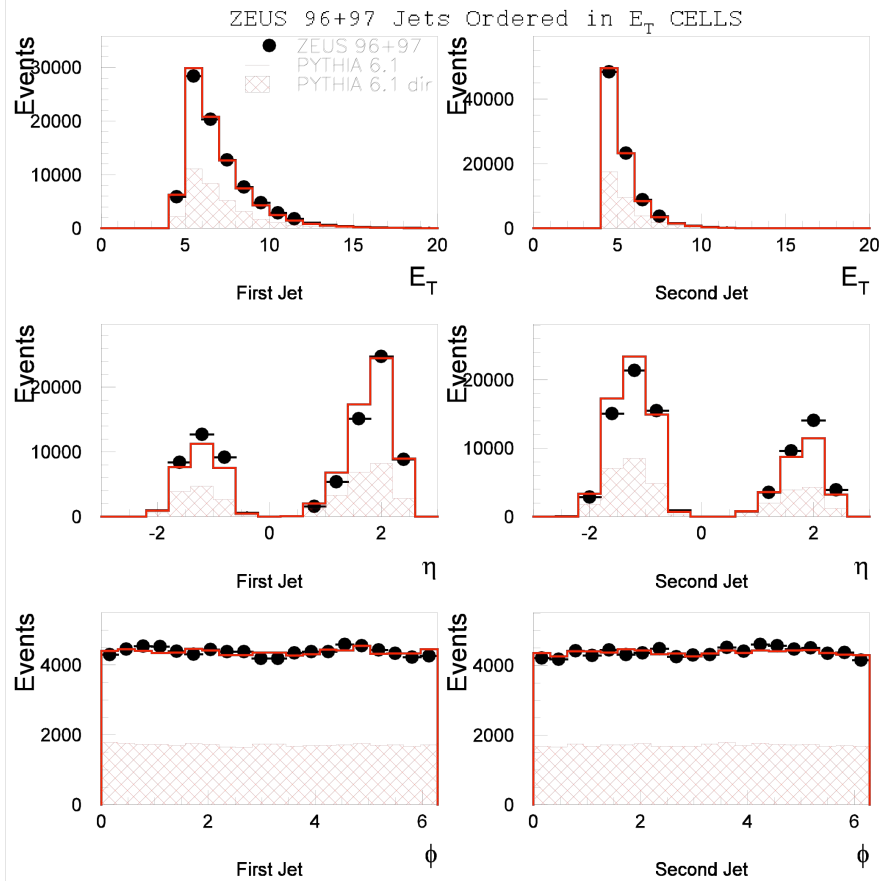

- $E_T^{\text{GAP}} < E_T^{\text{CUT}}$
- $E_T^{\text{CUT}} = 0.5, 1.0, 1.5, 2.0$  (Had)
- $E_T^{\text{CUT}} = 0.6, 1.2, 1.8, 2.4$  (Detector)

## •PYTHIA 6.1

- Direct, Resolved (MPI)
- PDF(p): GRV-LO
- PDF( $\square$ ): WHIT 2

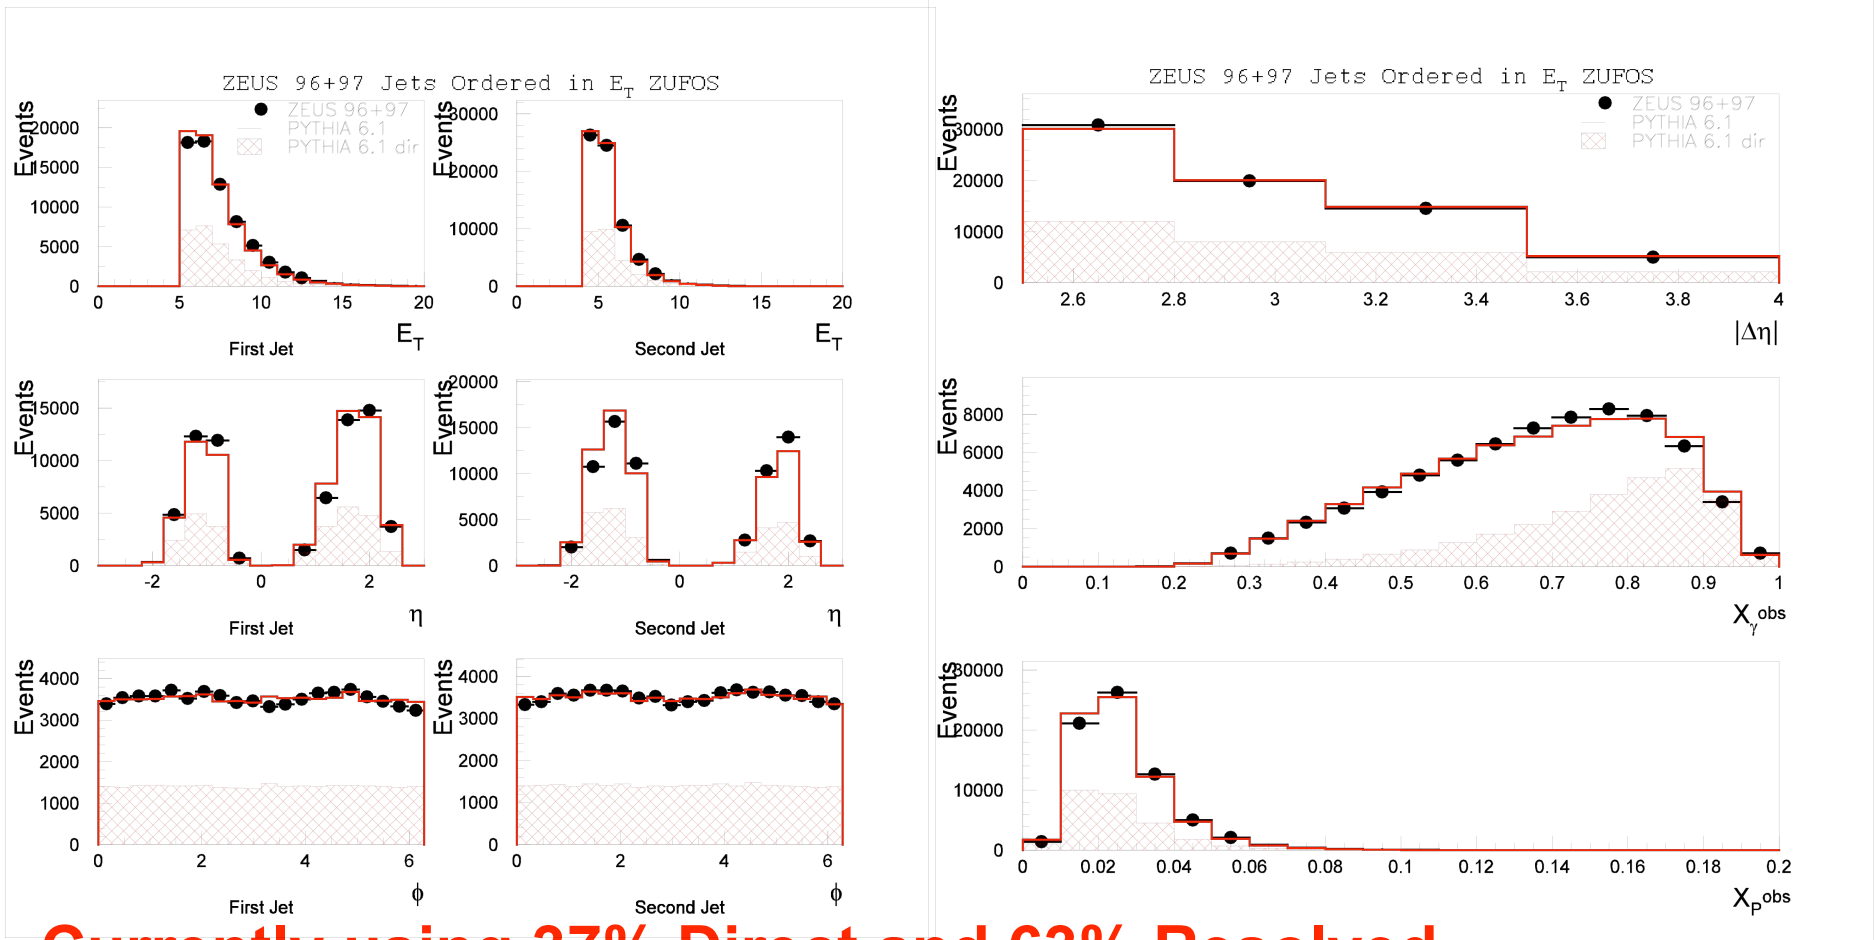

# Kinematic Quantities Jets reconstructed using Cells

**Currently using 37% Direct and 63% Resolved**

# Kinematic Quantities Jets Reconstructed using ZUFOS

**Currently using 37% Direct and 63% Resolved**  
**Equally good agreement between Data and MC for Cells and ZUFOS**

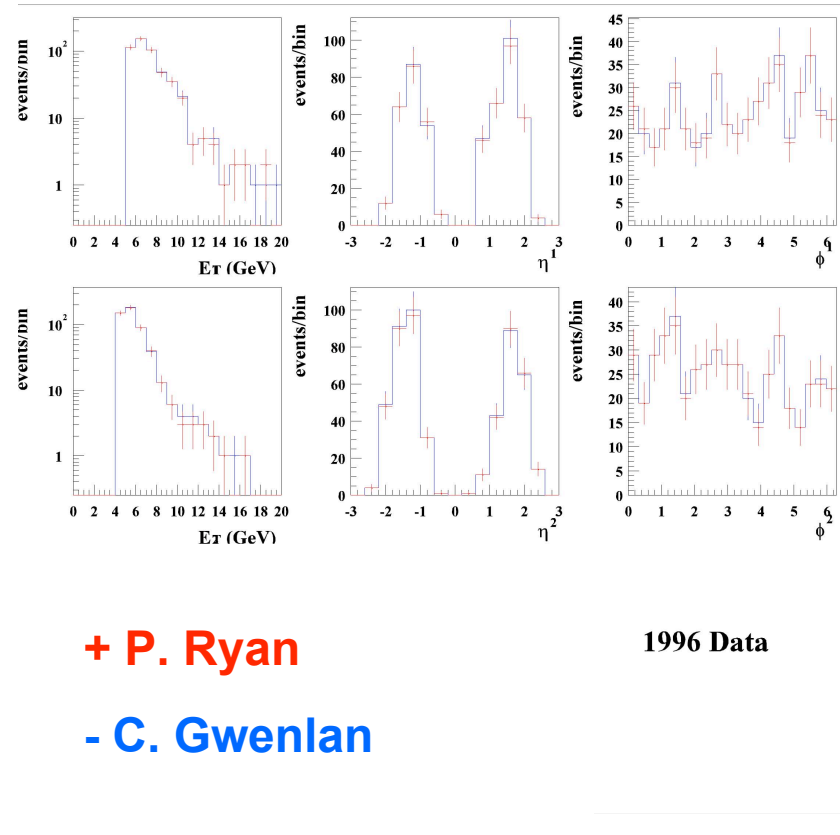

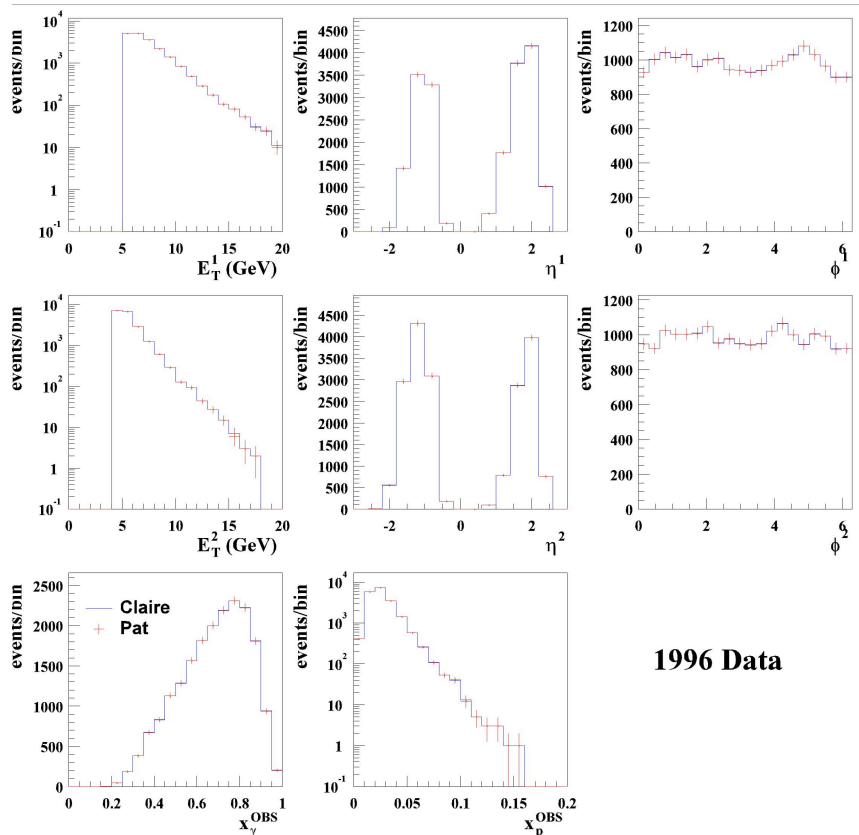

# Comparison between Analyses Data

## Inclusive Sample All Dijet Events

## Gap Sample Dijet Events with Rapidity Gap

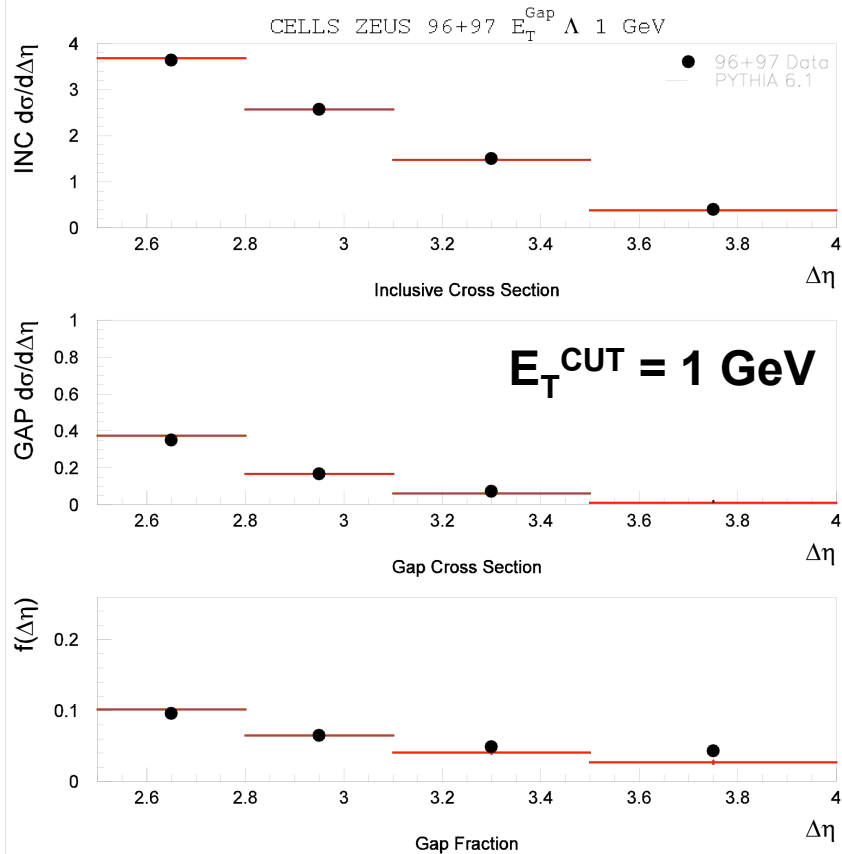

**Excellent agreement between the analyses**

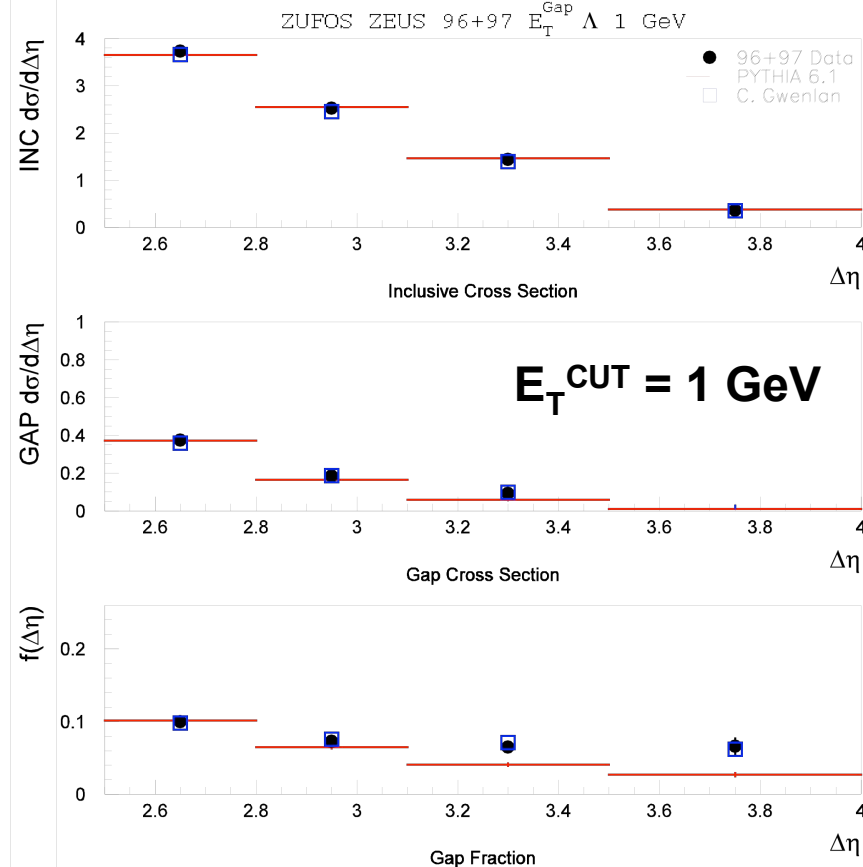

# Comparison between Analyses Corrected Cross Section (PYTHIA)

## CELLS

## ZUFOS

**P. Ryan: Reprocessed MC without color singlet exchange**

**C. Gwenlan: Unreprocessed MC with color singlet exchange**

# HERWIG

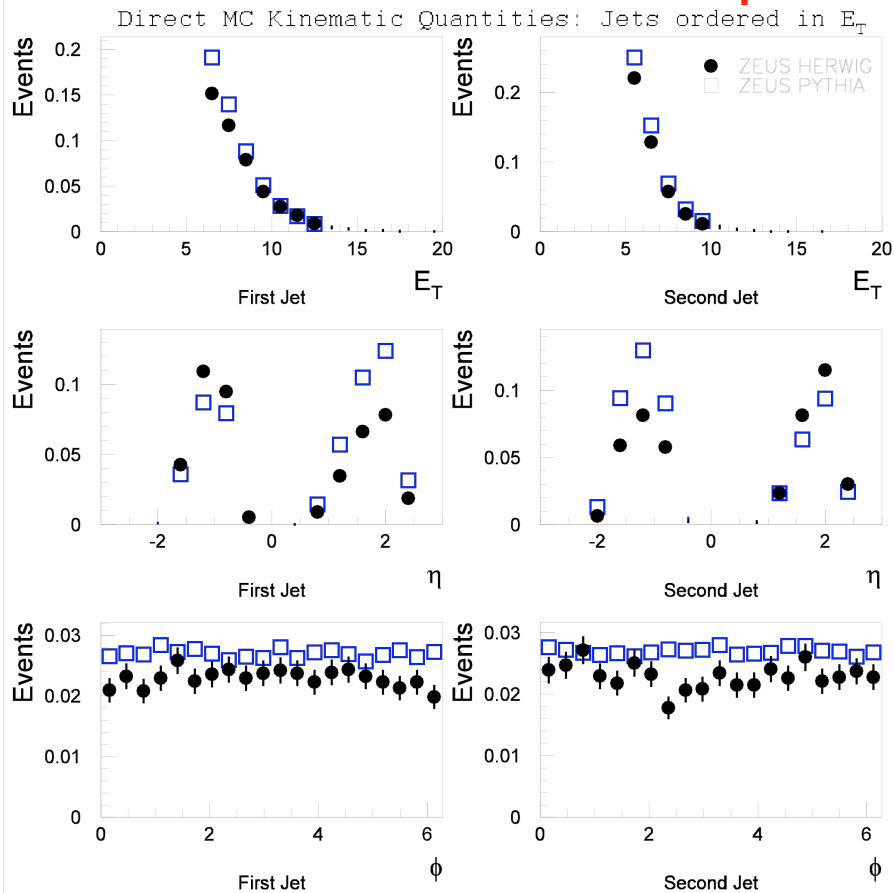

- **Last collaboration meeting**
  - In previous studies, HERWIG (5.9 stand-alone) and PYTHIA 6.1 disagree
- **This collaboration meeting**
  - New HERWIG 6.1 using ZEUS-Amadeus
  - Separately generated LO-Dir and LO-Res (with MPI)
  - PDFs
    - Proton: GRV-LO
    - Photon: WHIT 2

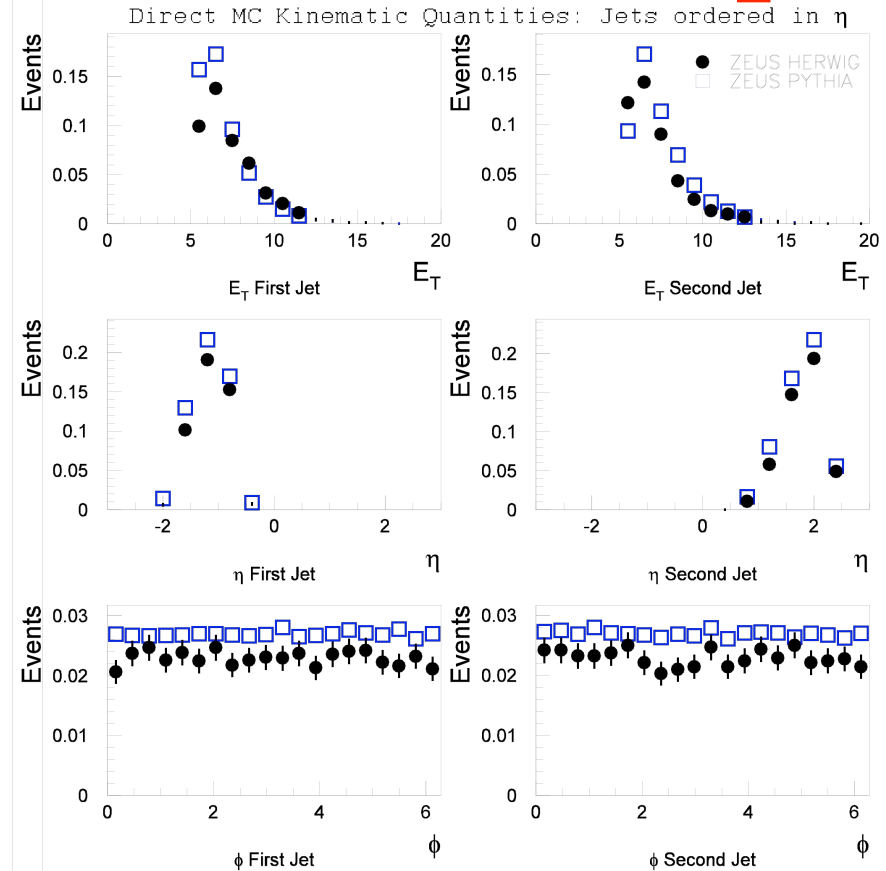

# HERWIG 6.1 vs. PYTHIA 6.1

## Jets ordered in $E_T$

## Jets ordered in $\eta$

**Normalized to respective Luminosities**

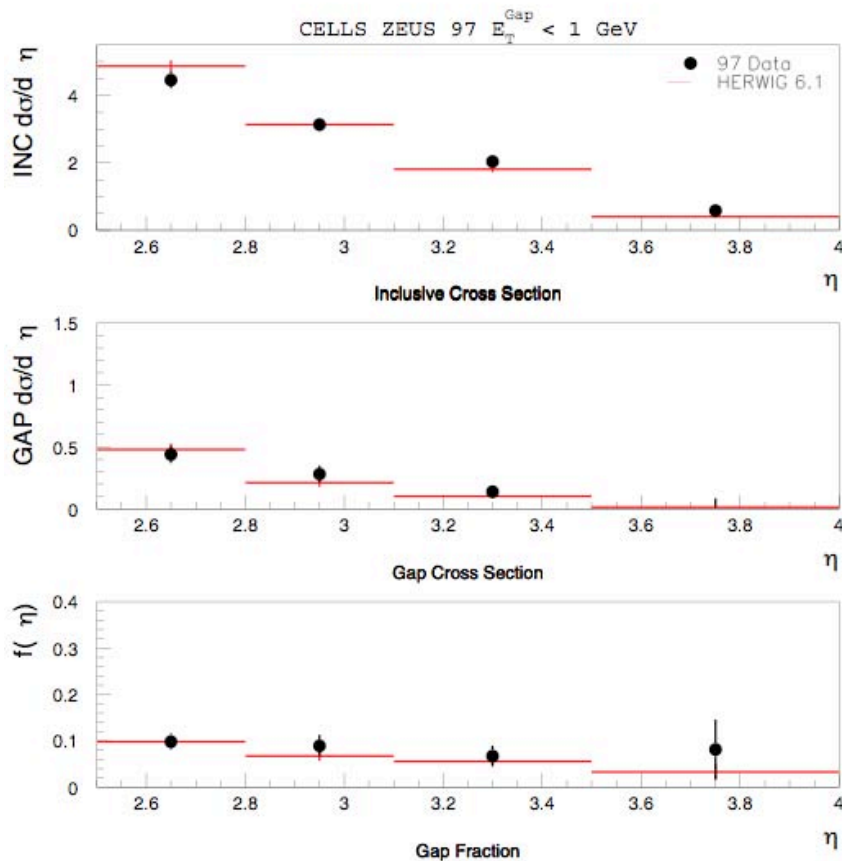

**Absolute cross section of PYTHIA larger than HERWIG**

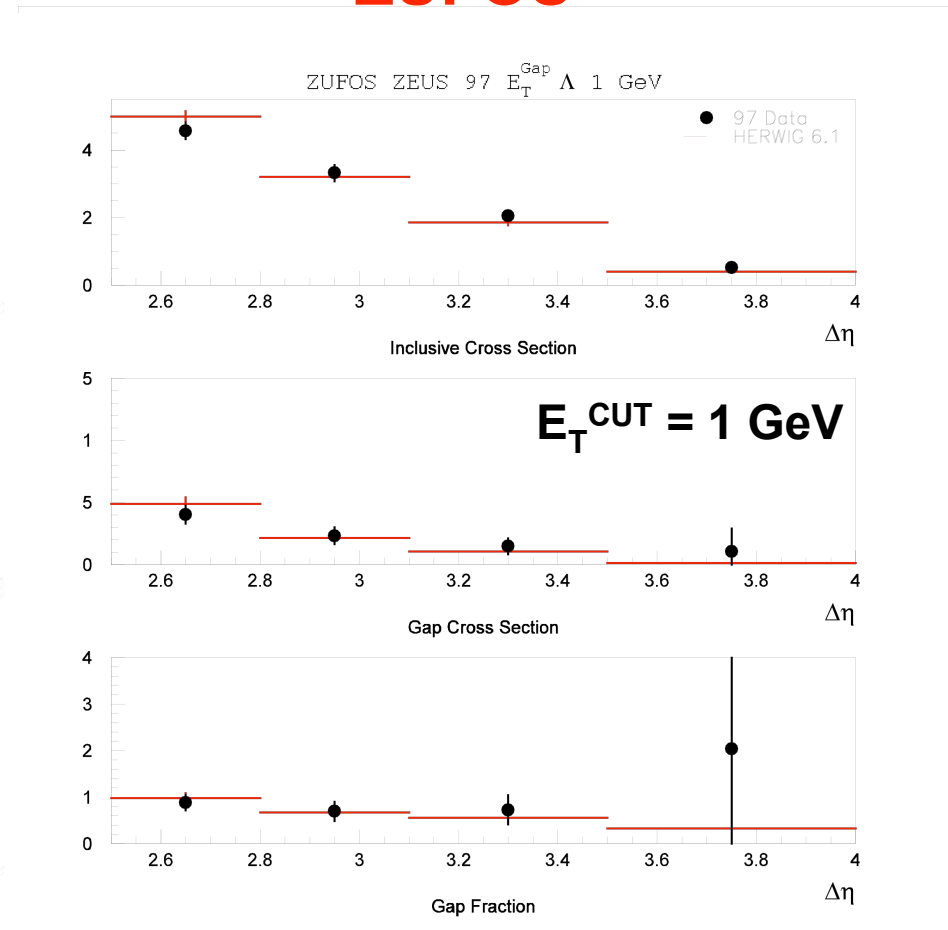

# Corrected Cross Sections HERWIG 6.1

## CELLS

## ZUFOS

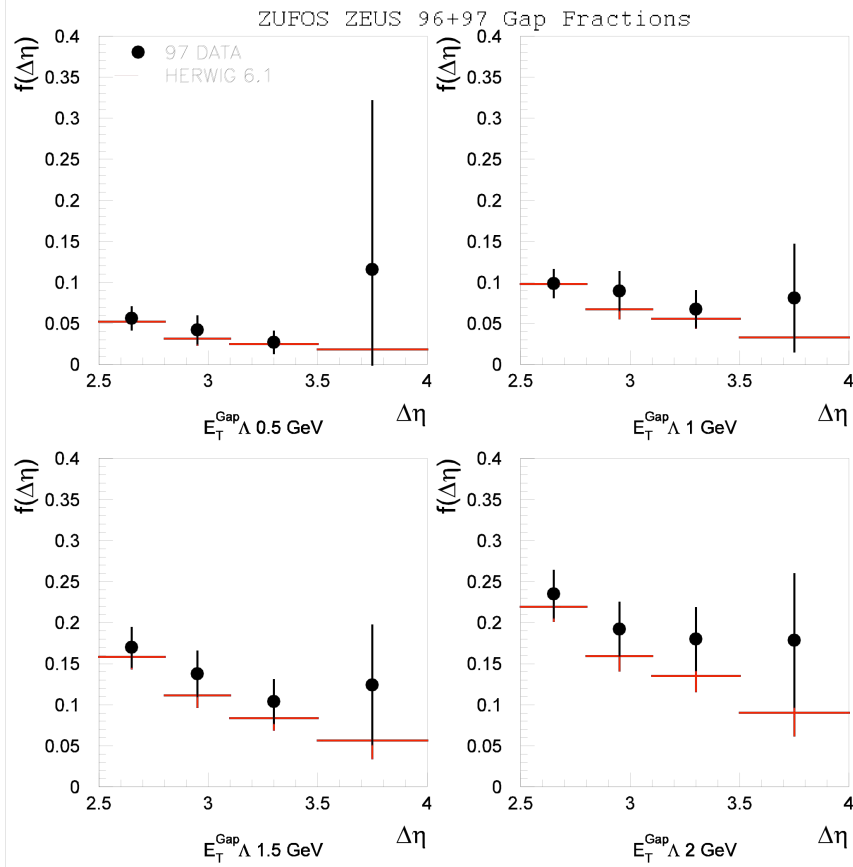

**HERWIG describes shape of data reasonably well**  
**Low MC Statistics, especially in highest  $\Delta\eta$  bin**

# Gap Fractions HERWIG 6.1

## CELLS

## ZUFOS

**HERWIG 6.1 does not include color singlet exchange**  
**Low MC statistics, especially in highest  $\Delta\eta$  bin**

# Summary

- **Conclusions**

- Good agreement between analyses of P. Ryan & C. Gwenlan for cross sections and gap fractions
- Cross Sections differ for PYTHIA and HERWIG

- **Plans**

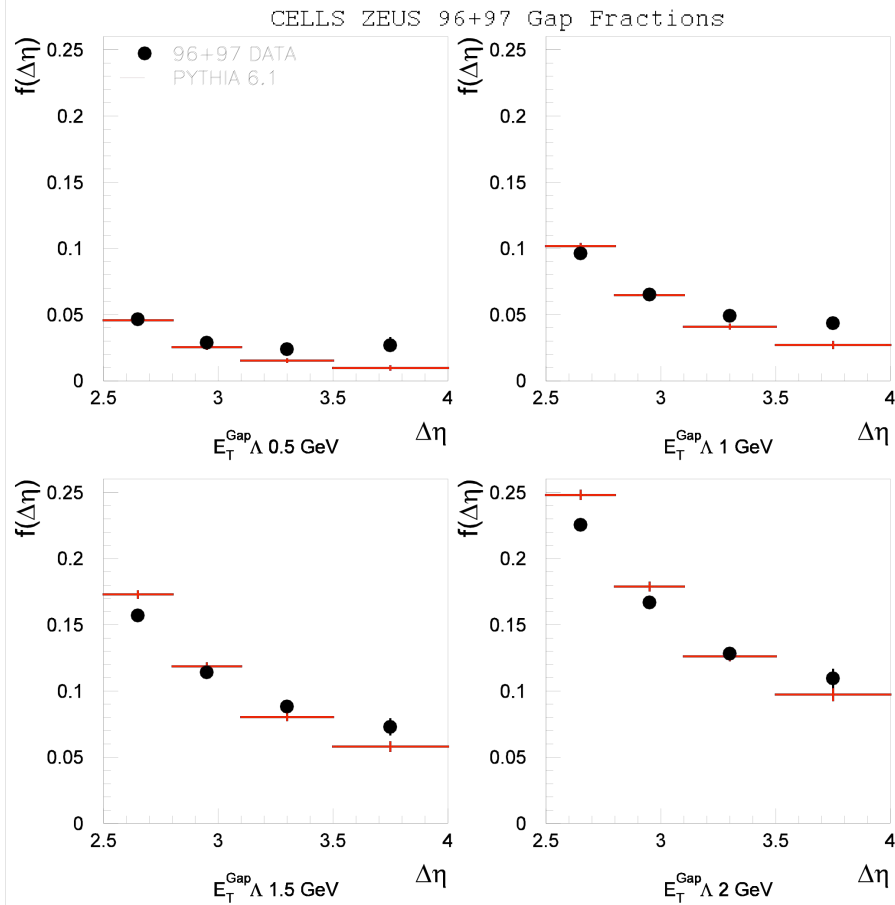

- Use MC with color singlet exchange
- Study differences between PYTHIA and HERWIG
  - More statistics needed for HERWIG
- Include larger data sample (98-2000 Data)
  - Can go to higher jet  $E_T$
  - Less sensitivity to underlying event models
- Paper to be written soon

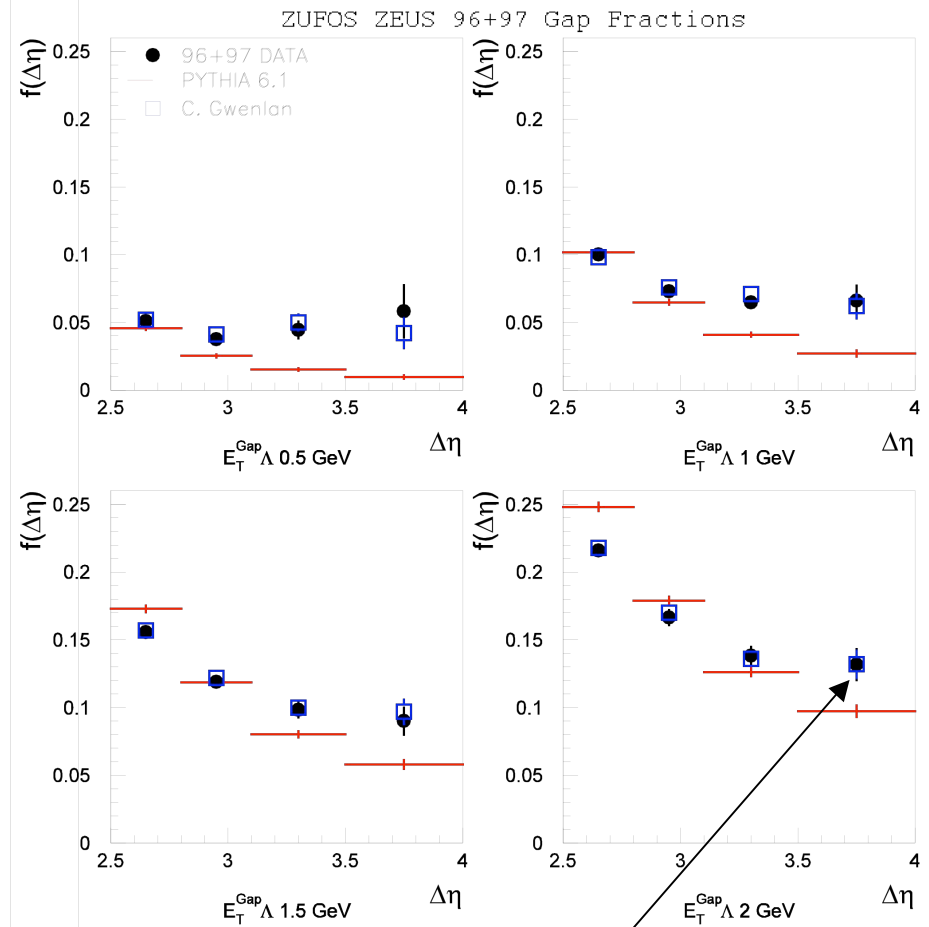

# Comparison between Analyses Gap Fraction

## CELLS

## ZUFOS

**PYTHIA 6.1 does not include color singlet exchange**

**Excess of data in highest  $\Delta\eta$  bin possible evidence of color singlet exchange**
